FORD

The Universal Car

Weak Links in a Strong Chain

They look strong enough, but the metal isn't there, the strong, durable Vanadium steel that goes into the Ford chassis and every Ford part. Ford parts are specially cast and heat-treated, each according to its use. Some require a hard, flint-like wearing surface, others need resiliency, and some need just "toughness."

Ford metallurgists have been studying these problems for sixteen years and know just how each unit should be made to endure a maximum of wear and tear. They know that best results can be obtained only by the use of special formulas for different parts, and that honest Ford parts wear from thirty-five to one hundred per cent longer than counterfeits.

We carry complete assortments of genuine Ford parts for both passenger cars and trucks. And our garage is equipped to give careful, prompt Ford service—from minor adjustments to complete overhauls. Drive in, it's better to be safe than sorry. Come to the Authorized Ford dealer for service.

RABBIT RAISING IS GOOD SCHEME

American People Beginning to Realize That Meat Is Superior for Home Table.

LITTLE CAPITAL IS NEEDED

Back-Yard Enterprise Turns Waste Materials and Spare Time Into Food—Selection of Breed Is Matter of Taste.

(Prepared by the United States Department of Agriculture.)

Rabbits have always been an important source of meat in Europe, but in the United States only a few of them were eaten except during the winter hunting season. Conditions resulting from the great war have awakened many Americans to the high value of rabbits and more and more people eat them regularly in their back yards for the family table.

Advantages of pruning and staking tomatoes are that a larger number can be set on a given area than by the methods of the amateur, who will ripen a little earlier on the plants that are pruned and staked; the fruit is held off the ground, is clean and easy to gather.

With the individual plants do not produce as large a quantity of fruit as when they are allowed to grow upon the ground, at least three times as many plants can be set on a given area, thereby increasing the yield.

The flesh of the young domestic rabbits is vastly superior in fiber and flavor to that of the wild rabbits. It easily resembles the white meat of chicken.

A profile 10-pound deer can easily raise in a year 20 young, which at 5 months will produce not less than 50 pounds of delicious meat. By means of compound hutches all this can be

done in a small space of ground, and the cost of raising the meat is less than the cost of the meat itself.

Rabbits Are Easy to Handle.

done on an area 4 by 6 feet. Half an hour of time a day, and some hay, roadside weeds, and refuse from orchards, gardens, and fields, will be sufficient to supply a family with all the meat it needs for a year.

Cost of Rabbit Raising.

The cost of starting a rabbitry depends on its size and on the price of material. One can buy two good does and a buck of breeding age—enough to supply an average family with all the meat it needs for a year—~~for anywhere from \$1.50 to \$10 each~~ for a total of from \$4.50 to \$10 each.

Hutches may vary in cost from a few cents each, the price of an empty dry hay bay, and a few dollars expended for dressed lumber to put together by a carpenter. On a farm where odds and ends of lumber and poultry netting usually are available, the cost of hay, grain, and milk are produced in the kitchen. The average cost of starting and carrying on a small rabbitry is negligible. In any case the initial cost need not be great. The daily cost when all feed is purchased is to train a rabbit to eat from a 10 or 12 pound rabbit, a recent publication on rabbit raising, published by the Bureau of Biological Survey of the United States Department of Agriculture, states:

Starting a breed is a matter of taste, although it may be influenced more or less by the market that is to be supplied. For example, the family table would demand smaller animals as for pets, while a trade in a restaurant or hotel. It is best to begin with one breeder and to concentrate on developing that stock into that may be a source of pride and profit.

One buck and two or three does are enough to start with. Young animals of breeding age and better than older ones which will soon be past their

prime.

Improvement of Dairy Herd.

Statement From Virginia Owner Reflects Sentiment for Upbuilding of Live Stock.

Rabbits Respond to Good Treatment.

Rabbitness. The buck should come from a different source from the does. It is always best to deal with reputable breeders and to examine stock before buying it.

Feeding the Rabbit.

American rabbits are fed on an uniform system of feeding rabbits. Some feed no green stuff, while others use all that is available. It is usually wise to avoid both extremes, but green feed must be used with more caution than is necessary with dry, and only the best of any green feed should be used. This means particularly that spaded, moldy, or dirty feeds are to be avoided, injurious to rabbits.

Clean, or whole, or crushed, turnips, hay, and a small portion of some kind of green stuff is the steady diet used in most rabbitries. Crushed rabbit may be substituted for oats; clover or alfalfa may be used with some oats or turnips, and the proportion of each of carrots, rutabagas, prunings from apple and cherry trees, and plantain, docks, burdock, dandelion, cauliflower, lettuce, or any other greens that may be available.

Bordeaux mixture is excellent for grapes. A combination spray of Bordeaux mixture and arsenate of lead is also effective. The vines may be sprayed just before they bloom; as soon as the blossoms fall, and a third time two weeks after the second application.

Superior Spray for Grapes.

Combination of Bordeaux Mixture and Arsenate of Lead is Suggested as Effective.

Bordeaux mixture is excellent for grapes. A combination spray of Bordeaux mixture and arsenate of lead is also effective. The vines may be sprayed just before they bloom; as soon as the blossoms fall, and a third time two weeks after the second application.

Ignorance No Excuse.

Humus binds together the soil particles and thus prevents the soil from drying by wind or washing by rain.

Economical Equipment.

Equipment that saves time and labor and affords a cleaner product from your dairy is economical.

Drinking Water Essential.

Drinking water, plentiful and warm in winter, cool and fresh in summer, is an absolute essential to healthy cattle.

Humus Opens Clay Soil.

Humus permits air to enter heavy clay soils more readily.

ADVISABLE TO PRUNE AND STAKE TOMATOES

Question Is Asked Every Year By Many Gardeners.

Advantages Are That Larger Number of Plants Can Be Set on Given Area—Quality of Fruit Is Usually Much Better.

Does It Pay to Prune Tomato Plants to a single stem and then to stakes or to trellises? This question is asked every year by thousands of home gardeners. It may be, according to the United States Department of Agriculture, that the best way is to leave the space for garden purposes as it is desired, and if the space for garden purposes is limited, and it is desired to make the best use of it, Tomato plants, if left to themselves, have a habit of spreading out over the garden and of producing their fruit right on the ground, where it becomes covered with dirt every time there is a rain.

Advantages of pruning and staking tomatoes are that a larger number can be set on a given area than by the methods of the amateur, who will ripen a little earlier on the plants that are pruned and staked; the fruit is held off the ground, is clean and easy to gather.

With the individual plants do not produce as large a quantity of fruit as when they are allowed to grow upon the ground, at least three times as many plants can be set on a given area, thereby increasing the yield.
